

6a) Personally, I was not surprised about the data, because of common inequities in America. So I expected the data to highlight marginalized communities' setbacks and the ways in which other communities are privileged.

6b) I think to convey this information I would use a bar graph so that it is easy to visually see and compare the percentages by race.

6c) I don't think the data is missing anything but I think it could have additional information to further describe the picture. This information could be the results of the test, such as the percentages of students who received a 4 or above, for each ethnicity. This would likely allow us to analyze the data on a deeper level.

6d) I think that this data can be used to tell a broader story about how white students tend to receive better opportunities which allow them to have a better educational background when competing or testing for certain accolades. This is clearly an inequity that is rooted very deeply into this country's history and needs to be fixed.
